BioIVT manufactures products derived from non-human primate tissue for the purpose of ADME-Tox research. All non-human primate tissues are obtained from sources within the US. Furthermore, BioIVT only procures tissues from healthy animals under the care of a veterinarian.

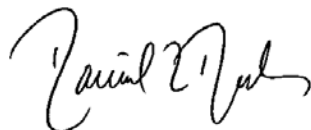

Any non-human primates entering the US are quarantined to ensure that the animals are not infected with a potentially dangerous virus. The non-human primate tissues that BioIVT procures are tested negative for the following:

- Herpes B virus (SBV)
- Simian Retrovirus (SRV)
- Simian Immunodeficiency virus (SIV)
- STLV-1
- Herpes Simplex-1
- Filo/Ebola
- Hepatitis B core antibody
- Hepatitis C

BioIVT also only accepts tissues from animals shown to not be infected with Salmonella.

BioIVT still strongly recommends that all researchers who use non-human primate-derived material to treat such material as a potential biohazard.
